NOTES, WARNINGS and CAUTIONS

Information that is especially important to note is identified by following labels:

• NOTE
• WARNING or CAUTION
• IMPORTANT
• TIP

**NOTE:** Provides you with information that is important to successfully setup and use the iServer.

**CAUTION or WARNING:** Tells you about the risk of electrical shock.

**CAUTION, WARNING or IMPORTANT:** Tells you of circumstances or practices that can effect the instrument’s functionality and must refer to accompanying documents.

**TIP:** Provides you helpful hints.
PART 1
INTRODUCTION

1.1 Safety and EMC Considerations

This device is a stand alone low voltage (5Vdc) Ethernet Server to be integrated into a design or system. Installation of this device should be done by qualified personnel and should follow electrical safety requirements in accordance to EN 61010-1:2001 or EN 60950 safety standards.

EMC Considerations
• Whenever EMC is an issue, always use shielded cables.
• Never run signal and power wires in the same conduit.
• Use signal wire connections with twisted-pair cables.
• Install Ferrite Bead(s) on signal wires close to the instrument if EMC problems persist.

Failure to follow all instructions and warnings may result in injury!

1.2 Before You Begin

Inspecting Your Shipment:

Remove the packing slip and verify that you have received everything listed. Inspect the container and equipment for signs of damage as soon as you receive the shipment. Note any evidence of rough handling in transit. Immediately report any damage to the shipping agent. The carrier will not honor damage claims unless all shipping material is saved for inspection. After examining and removing the contents, save the packing material and carton in the event reshipment is necessary.

Customer Service:

If you need assistance, please contact the Customer Service Department nearest you.

Manuals, Software:

The latest operator's manual as well as free iServer configuration software (iCONNECT) and iServer Mail Notifier software are available at the WEB site listed on the cover page of this manual. They may also be on the CD-ROM enclosed with your shipment.
1.3 Description

The iServer is a stand alone Ethernet Server designed to connect devices with serial interfaces to the Ethernet network using the TCP/IP protocol. It contains Ethernet and RS-232/485/422 interfaces.

The standard features include:
- Use standard Web Browser, TCP connection, HTTPGET DOS program or Telnet Simulation, for network connectivity.
- Install via RS-232/485/422 serial port connection.
- Use a standard home page or customize Web page for OEM applications.

This device can be purchased as a stand alone DIN Rail mounted unit, or as a bench/wall mount unit.

The following example illustrates how you can hookup the devices with serial interface on the network using the iServer:

![Diagram of iServer hookup](Figure 1.1 Accessing devices over the Ethernet)
PART 2 HARDWARE

2.1 Mounting
Position unit where required. Mark and drill holes as required.

2.2 DIP Switches
1. To change the IP address, gateway address, and subnet mask from the serial port
2. To change to default factory settings
3. To enable/disable DHCP
4. To enable/disable Terminal Server function

![Figure 2.1 Mounting]

The iServer is shipped with all DIP switches in "OFF" position.

To set the iServer to factory default settings, slide DIP switch #2 to ON position. Power the iServer on and wait about 10 seconds until the iServer fully boots up. Set the DIP switch #2 back to OFF position (it does not matter if the iServer is powered ON or OFF, just make sure that the DIP switch is set to OFF, otherwise, every time the unit is power-cycled the factory settings will take over. See Section 4.6 for setting the iServer to factory default using the firmware (over the LAN).

To enable the DHCP, besides using DIP switch #3, set the iServer’s IP address to 0.0.0.0.

An iServer with IP address of 0.0.0.0 will request an IP address, gateway address, and subnet mask from the DHCP server over the Ethernet.

![Figure 2.2 DIP Switches]
2.3 Parts of the iServer Unit

Pin headers can be installed on either side of the board for the serial interface (J16A), in place of RJ45 Ethernet port (J17), Reset Switch (J18), and in place of the LEDs.

2.4 Serial Communication Interfaces

Two communication interfaces are supported in the standard iServer: RS232 and RS485. In addition, the serial port can also be provided with TTL logic on request. These standards define the electrical characteristics of a communication network. The RS485 port of the iServer is fully compatible to use with RS485 and RS422 instruments. The RS485 is an extended version of the RS422 communication standard which increases the allowable number of devices from 10 to 32 by improving the electrical characteristics.

- The **RS232** standard (point-to-point) allows a single device to be connected to an iServer. The iServer operates with full-duplex RS232 using eight wires: Rx-receive, Tx-transmit, DTR, DSR, DCD, CTS, RTS and common ground wires. RS232 cable length is limited to 50 feet.

- The **RS485** standard (multi-point) allows one or more devices (multi-dropped) to be connected to the iServer using a two-wire connection (half-duplex) +Rx/+Tx and –Rx/-Tx. Use of RS485 communications allows up to 31 devices to connect to the iServer with cable length up to 4000 feet long.

Although the RS485 is commonly referred to as a "two wire" connection, the iServer also provides a ground/return shield connection to use as a common connection for EMI noise protection.

- The **TTL** standard (point-to-point) allows a single device to be connected to an iServer. The iServer operates with full-duplex TTL using three wires: Rx-receive, Tx-transmit, and common ground wires.

Table 2.2 shows the differences between RS232 and RS485 communication interfaces.

<table>
<thead>

<td>50 ft (15 meters)</td>
<td>4000 ft (1200 meters)</td>
</tr>
</tbody>
</table>

Changing between RS232 and RS485 interfaces, as well as modifying the other parameters is possible through the iServer firmware using its home Web page or Telnet connection (see Part 4 for details).

2.4.1 Wiring RS232 Interface

Table 2.3 shows the signals and the direction of signals on the DB9 (DTE configuration) RS-232 Serial Port.

2.4.3 Wiring RS485 Interface

RS485 interface uses a two-wire communication system (one for transmitting and one for receiving) plus a common wire to connect to the shield of the cable. It is recommended to use a shielded cable with one twisted pair.

**Note** Use of twisted pair and shield will significantly improve noise immunity.

Figure 2.5 shows multi-point, half-duplex RS485 interface connections for the iServer.

**Figure 2.5 Multi-point, Half-Duplex RS485 Wiring**

Value of the termination resistor is not critical and depends on the cable impedance.

Table 2.5 shows RS485 half-duplex hookup between the iServer serial port and device with RS485 communication interface.

2.5 Network Communication Interfaces

2.5.1 10Base-T RJ-45 Pinout

The 10BASE-T Ethernet network (RJ-45) system is used in the iServer for network connectivity. The 10 Mbps twisted-pair Ethernet system operates over two pairs of wires. One pair is used for receiving data signals and the other pair is used for transmitting data signals. This means that four pins of the eight-pin connector are used.

The table below shows the pin assignments for the RJ-45 connector:

<table>
<thead>
<tr>

![Figure 2.6 RJ45 Pinout](image)

2.5.2 10Base-T Crossover Wiring

When connecting the iServer directly to the computer, the transmit data pins of the computer should be wired to the receive data pins of the iServer, and vice versa. The 10Base-T crossover cable with pin connection assignments are shown on Figure 2.7.

![Figure 2.7 10Base-T Crossover Cable Wiring](image)

Use straight through cable for connecting the iServer to an Ethernet hub. The ports on the hub are already crossed.
PART 3
NETWORK CONFIGURATION

3.1 Network Protocols

The iServer can be connected to the network using standard TCP/IP protocols. It also supports ARP, HTTP (WEB server), DHCP, DNS and Telnet protocols.

3.2 Ethernet (MAC) Address

MAC (Media Access Control) address is your computer’s unique hardware number. When you’re connected to the LAN from your computer, a correspondence table relates your IP address to your computer’s physical (MAC) address. The MAC address can be found on the label of your device and contains 6 bytes (12 characters) of hexadecimal numbers XX:XX:XX:XX:XX:XX hex.

For example: 0A:0C:3D:0B:0A:0B

Note There is a duplicate MAC address label included with your unit.
3.3 DHCP

DHCP, Dynamic Host Configuration Protocol enables individual computers or devices to extract their IP configurations from a server (DHCP server). If the DHCP is enabled on your iServer, as soon as the iServer is connected to the network, there is an exchange of information between DHCP server and the iServer. During this process the IP address, the Gateway address, and the Subnet Mask will be assigned to the iServer by the DHCP server. Note that the DHCP server must be correctly configured to make such assignment. The DHCP can also be enabled if the iServer’s IP address is set to 0.0.0.0.

If fixed or static IP address is desired, the DHCP must be disabled. The iServer is shipped with DHCP disabled (factory default). The DHCP can be enabled by setting the DIP switch # 3 to the “ON” position (refer to Figure 3.2).

3.4 DNS

DNS, Domain Name System enables individual computers and devices to be recognized over a network based on a specific name instead of an IP address. For example, instead of having to use http://192.168.1.200 (IP address), you would use only http://eis03ec or any eight character name stored as Host Name under Access Control page in the iServer Home Page. The default DNS name for an iServer is "eis" followed by the last four digits of the MAC address of that particular iServer.

1. It is very important to communicate with the network administrator in order to understand the DHCP and its existing configurations on the host server, before enabling the DHCP on the iServer.

2. The iServers are shipped with a default static IP address of 192.168.1.200 and Subnet Mask of 255.255.255.0.

3. On Novell networks or Windows 2000 where the DHCP is an updated function of DNS this feature may be beneficial since a particular name can be assigned eliminating the need for the IP address, as described in Section 3.4.
3.5 IP Address

Every active device connected to the TCP/IP network must have a unique IP address. This IP address is used to build a connection to the iServer’s serial port. Every computer using TCP/IP should have a unique 32-bit address. It is divided into two portions, the network ID and the host ID. For instance, every computer on the same network uses the same network ID. At the same time, all of them have a different host ID. For more details about the IP address see Appendix B.

3.5.1 Default IP Address

The iServer is shipped with a default IP address set to 192.168.1.200 and Subnet Mask of 255.255.255.0. If you are going to use a Web browser or Telnet program to access the iServer using its default IP address, make sure that the PC from which you’re establishing the connection has an IP address that is in the same range as the iServer’s IP address (192.168.1.x, where x can be any number from 1 to 254).

Your PC’s IP address cannot be the same as the iServer’s IP address.

You also need to make sure that your PC’s Subnet Mask is 255.255.255.0. This is a good way to access the iServer over the network and make any configuration changes needed. If the factory default address is already in use on your network, use an Ethernet crossover cable between your computer and the iServer and modify the IP address or any other settings within the iServer.

3.6 Port Number

All TCP connections are defined by the IP address and a port number. A port number is an internal address that provides an interface between an application running on your computer and the network through the TCP/IP protocol.

There are three default TCP port (socket) numbers assigned to the iServer:

1. Port (socket) number 1000 when using HTTPGET program.
2. Port (socket) number 2000 when trying to access your serial device connected to the serial port of the iServer.
3. Port (socket) number 2002 when trying to access the iServer itself for reading or changing the settings. This can be done using Telnet application.

Example: C:\>Telnet 192.168.1.200 2002
PART 4
OPERATIONS

This iServer can be used and configured in several ways, depending on user’s preference and network setup. It can be used in Telnet simulation mode where it emulates serial communication operation over a network cable or directly from a Web browser, like Netscape or Internet Explorer. It can also be configured using NEWPORT’s iCONNECT Configuration Software.

If DHCP and DNS servers are used, the connection is very simple, you do not need to worry about IP address, MAC address, or network conflicts, all of these issues are solved for you by your network DHCP and DNS server. All that is left for you to do, is to enable DHCP on the iServer (see Section 2.2) and use a straight network cable to connect the iServer to a hub and power it up.

If DHCP is not the preferred method, you can configure your PC’s network connection with an IP address of **192.168.1.x** that is in the same range as the iServer’s default IP address (**192.168.1.200**) and connect to the iServer using a cross-over network cable between your PC’s network port and the iServer. After you’re done with configuring the iServer, you can always set your PC back to its original settings.

On your computer, from the MS-DOS Prompt window type "ping **192.168.1.200**" and press Enter. If DHCP and DNS servers are used type “ping **eisxxxx**”, where xxxx are the last four digits of the iServer’s MAC address, located on the back of the device. You should get a reply as shown in Figure 4.1.

![Figure 4.1 Pinging eis03ec MS-DOS Prompt](image)

This proves that the connection is proper and you can get into configuration or run mode using the Telnet or Web browser.
4.1 iCONNECT Software
The iServer may also be assigned an IP Address by using the iCONNECT software.

a) Download the iCONNECT software from the website listed in this manual.

b) Install iCONNECT software on a networked PC. This software is compatible with Windows 95, 98, NT, 2000, and XP.

c) Use iCONNECT to assign an IP address to the iServer and access its web pages for configuration. You can also use any standard web browser to access the iServer's web pages. Consult with your IT department for obtaining an IP address.

![Figure 4.2 Assigning an IP Address using iCONNECT](image)

To access the iServer for Configuration.

a) By clicking on the “View Webpage” button, you will access the iServer’s homepage, refer to Section 4.2.

![Figure 4.3 Accessing the iServer for Configuration](image)
4.2 Setup and Operation Using a Web Browser

- Start your web browser.
- In the URL field, type `http://eisxxxx` using the last four-digits from the MAC address label located on the device if DHCP and DNS are used. If a static IP address is used, then simply type `http://x.x.x.x`, where `x.x.x.x` is the iServer's IP address.
- The Home Page, shown below, will be displayed.

```
Figure 4.4  iServer Home Page Menu
```

In order to access certain menu items of the Home Page, users may be prompted for a password, as shown in Figure 4.5.

```
Figure 4.5  LOGIN and ADMINISTRATOR Passwords
```

There are 2 different access levels:

1. **ADMINISTRATOR Password** (administrator) allows certain groups and individual users to access and modify "All" iServer pages items without any restrictions.
   - The default password is `00000000`. This password can be up to 16 alphanumeric case-sensitive characters.

2. **LOGIN Password** (operator) allows users to access and modify all of the iServer Home Page menu items, except “Access Control” which requires an Administrator password. The "Read Devices" does not require a password.
   - The default password is `12345678`. This password can be up to 16 alphanumeric case-sensitive characters.
4.2.1 Device Setup

From the iServer Home Page, this option allows the users to add up to eight devices (in RS485 mode) and the iServer will send the entered commands out and will receive the responses from those devices. The responses can be seen by clicking on the “Take Readings” button.

Since only one device can be connected in an RS232 connection, there should be only one device entered in the “Device Setup” page.

By clicking on the numbers from 1 to 8, the parameters for each device can be defined.

![Click on numbers for Device Parameters](image)

**Figure 4.6 Device Setup**

In the “Device Parameters” page the “Device Name” and the “Response Unit” fields are simply text fields and each can take up to eight alphanumeric characters. The “Device Command” field is where the actual command is typed. The iServer will send this command to the serial device as soon as the “Take Reading” button is clicked.

![Click on Device No. on the left to modify Device Parameters](image)

**Figure 4.7 Device Parameters**

In RS485 connection, the RS485 node number must be typed before the actual command.

Example: *01 is the RS485 node number 1 and the X01 is the actual command requesting temperature value.

![Note](image)
4.2.2 Read Devices

From the iServer home page, when selecting “Read Devices” option, you could be prompted with the following error message.

To be able to select the “Read Devices” option, you need to click on the “Configuration” option and change “Number of Connections” to 0 (see Figure 4.11). Make sure to Save the page and click “Read Devices” option again.

After adding the Parameters, including the “Device Command” described in the “Device Setup” page, the “Read Devices” option allows you to monitor the response back from the serial device.

If you have 000, click the Auto Update button to manually refresh the page. If you want to change the time interval of the page refresh, enter the amount of seconds in the box.

4.2.3 Device Query

From the iServer Home Page, when selecting “Device Query” option, you could be prompted with the following error message, shown in Figure 4.8.

To be able to select the “Device Query” option, you need to click on the “Configuration” option and change “Number of Connections” to 0 (see Figure 4.11). Make sure to Save the page and click “Device Query” option again.

The “Device Query” option allows you to send a command to a single serial device connected to the iServer and displays the response back from that serial device. If the connection is RS485, the RS485 node number must be typed before the actual command.

Example: *01 is the RS485 node number 1 and the X01 is the actual command requesting temperature value.
4.2.4 Configuration
This section describes the "Configuration" page of the iServers's Web interface.

To get into the Configuration page, the user will be prompted with a Login Password. The default Login password is 12345678 and is changeable, if desired.

When connecting your serial device to the iServer, the Serial Communications parameters (baud rate, data bit, parity, and stop bit) must be the same on both, the iServer and your serial device.

![Configuration Page](image)

**Figure 4.11  Configuration**

4.2.4.A Serial Communication
**Baud Rate:** The serial port speed can be set from 300 to 115,200 bits/s (default is 9600 bits/s.)

**Data Bit:** Options are 7 or 8 (default is 8 bits.)

**Parity:** Options are Odd, Even, and None (default is None.)

**Stop Bits:** Options are 1 and 2 bits (default is 1 bit.)

**Flow Control:** Options are Software Flow Control (Xon/Xoff), Hardware Flow Control (CTS/RTS), and None (default is None.).
4.2.4.A Serial Communication (continued)

Transceiver: The iServer’s DB9 serial port can either be set to RS-232 or two-wire RS-485 (default is RS-232.)

Modbus/TCP: A widely used protocol mainly in industrial automation applications with default TCP port number of 502 (see Local Port field). The options are Enable and Disable. If enabled, the Modbus/TCP is the only protocol driven by the iServer on its LAN port. If disabled, the TCP/IP is the only protocol driven by the iServer on its LAN port (default is disable).

End Character: When the defined Hex character is received by the iServer on its serial port, the iServer will forward the buffered serial data to the Ethernet. The default value is 00, which forces the iServer to forward the data to the Ethernet as it receives the data on its serial port (this means that the iServer requires NO “end character” to forward the data).

Forward End Char: If enabled, the iServer will send the End Character out to the Ethernet as part of the data. If disabled, the iServer will not count the End Character as part of the data and will drop it (default is enabled.)

Timeout: In RS232 connection, if the iServer does not receive any more serial data within the given time value, the iServer will forward the buffered serial data to the Ethernet. For example, if the Timeout is set to 200 ms, the iServer will send out the buffered serial data to the LAN, if it does not receive any more data on its serial port for a period of 200 ms.

In RS485 connection, the Timeout value is used to switch between serial transmit and receive mode. Since the iServer supports 2-wire RS485, it needs to either transmit or receive serial data and the Timeout value determines the time interval for each. The range can be from 0 to 9999 ms (default is 0 ms).

Serial Port Password: The Telnet connection to the iServer’s serial port (default port 2000) can be password protected if this option is enabled (default is disable). If enabled, the actual password can be placed in the next field.

4.2.4.B Terminal Server

TCP/UDP: The iServer supports TCP and UDP protocol (default is TCP). If UDP is selected, it can be configured either for Broadcast UDP or Directed UDP. In case of Broadcast UDP, the iServer will transmit the serial data to every node on the network. This can be accomplished if the Remote IP Address is set to 255.255.255.255.

The Broadcast UDP is a practical solution when one device needs to communicate with multiple PC’s or devices over the network (one-to-many connection). In the case of directed UDP, the iServer will transmit the serial data to a specific node on the network (one-to-one connection). This can be accomplished if the Remote IP Address is set to the IP address of that specific node.

Server Type: In most cases the iServer will be acting as a Slave device. Slave option is chosen when a network host needs to connect to the serial port of the iServer (default is Slave).

Number of Connections: The range is from 0 to 5. If 0 is selected, the Terminal Server feature is disabled. This means that no network connection can be made to the serial port of the iServer. If 1 is selected, only one network connection can be made to the iServer's serial port. Any number more than 1 would allow the network hosts to monitor (read only) the traffic on the iServer’s serial port simultaneously, but only one network host would be allowed to read and write (default is 5).
4.2.4B Terminal Server (continued)

**Local Port:** This is the port or socket number for the iServer’s serial port. Any number between 500 and 9999 can be defined with the exceptions of 1000 and 2002 which are already used by the iServer for other purposes (default is 2000.) Port number 502 is the default socket number for Modbus/TCP protocol. If Modbus/TCP is enabled in the iServer, it’s then suggested to use 502 for the Local Port unless your host software that supports Modbus/TCP indicates otherwise.

If your application software is IP enabled, it means that it can open a connection to a node on the network (i.e. iServer with the attached serial device) with an IP address and a port number. In some cases the application software may not allow you to specify the iServer’s port number (it only allows you to enter the iServer’s IP address). In these cases, you should put 23 in the Local Port field of the iServer. By doing this, the iServer will forward connections that are made to its Ethernet port directly to its serial port.

**Connection Control:** Some serial devices accept connections or disconnect connections based on certain signal conditions. For example, a serial device may accept a connection only if the incoming DTR signal (connected to device’s DSR or DCD) is high or low. In this case, when the iServer receives the TCP connection, before it forwards it to its serial port, it must raise its DTR (DTR+) or to lower its DTR (DTR-). The iServer is capable of doing this with any of the hardware or modem control signals (DTR, DSR, DCD, RTS, and CTS).

"Reconnect" is one of the options in the Connection Control menu. This option can be used in the Serial Tunneling described in Section 4.10. If the connection in Serial Tunneling is broken due to network problems, power failure, etc., the Reconnect option will try to get the connection back on line every whatever the "Connection Timeout" is set to. For Example, if the Connection Timeout is set to 1000 x10 ms or 10 seconds, then every 10 seconds the iServer attempts to reconnect and reestablish the serial tunnel to the other network node.

**Device No.:** Refer to Section 4.2.1

4.2.4.C Remote Access (Tunneling)

**Remote Access:** This option needs to be enabled when Serial Tunneling is configured. The Serial Tunneling is explained in detail in Section 4.10.

Changes made in the iServer’s Configuration page can be saved permanently by pressing the Save button. Pressing the Reset button will set all the fields back to their default values.
4.2.5 Configure Access Control

This section describes the "Access Control" page of the iServers’s Web interface. This page allows the users to set up the network and security parameters of the iServer.

To get into the Access Control page, the user will be prompted with an Administrator Password. The default Admin password is **00000000** and is changeable, if desired.

At the initial entrance to the “Access Control” page you will be prompted for the Login Password (see Figure 4.5) prior to an Administrator Password.

![Access Control Page](image)

**Figure 4.12 Access Control**

**Login Password:** This allows users to access and modify all of the iServer Home Page menu items, except “Access Control”, which requires an Administrator password. The default Login password is **12345678**. This password can be up to 16 alpha-numeric case-sensitive characters.

If there is no Login Password assigned (blank box) the iServer will not require a password to access and modify iServer Home page menu items.

**Admin (administrator) Password:** This allows users to access and modify the "Access Control" page. The default password is **00000000**. This password can be up to 16 alpha-numeric case-sensitive characters.

If there is no Administrator Password assigned (blank box) the iServer will not require password to access and modify "Access Control" page.

**Web Server:** This will allow or disallow accessing the iServer’s Web server using an Internet browser (default is enabled.)

**Host Name:** Refer to Section 3.4, DNS.
4.2.5 Configure Access Control (continued)

**MAC Address:** This is also called Hardware address or Ethernet address, which is assigned to the iServer at production. The MAC (Media Access Control) address is the iServer’s unique hardware number and is not changeable.

**IP Address:** The IP (Internet Protocol) address is a 32-bit number that identifies each sender or receiver of information that is sent in packets across the Ethernet or the Internet. The iServer’s default IP address is **192.168.1.200**. The iServer’s IP address should be changed to fit user’s networking environment. Consult with your IT department for obtaining an IP address.

![Note]

The DHCP will be enabled in the iServer if its IP address is set to **0.0.0.0**. The DHCP can also be enabled by setting the dip switch number 3 to ON position.

**Gateway Address:** A gateway is a network point that acts as an entrance to another network. A gateway is often associated with a router, which knows where to direct a given packet of data that arrives at the gateway. If the iServer is sending packets to another network node that is not on the same network on which the iServer is connected, a gateway address needs to be given to the iServer. The gateway address should be the IP address of the router connected to the same LAN to which the iServer is connected. The iServer’s default gateway address is **0.0.0.0**. Consult with your IT department for obtaining a gateway address.

**Subnet Mask:** It’s a 32-bit number that is used to determine which part of the IP address is the network portion and which part is the host portion. The iServer’s default subnet mask is **255.255.255.0**. Consult with your IT department for obtaining a subnet mask.

![Note]

Changes made in the iServer’s Access Control page can be saved permanently by pressing the Save button and power recycling the iServer (press Power Recycle button). Pressing the Reset button will set all the fields back to their default values.
4.3 Setting a New IP Address using the Serial Port

Once you know the IP address that you need to put on your iServer you can use a serial connection (Terminal Emulation) to assign the IP address to the iServer.

Setting the IP address over the serial port requires a crossed-over (null modem) serial cable and Hyper Terminal or any terminal emulation program. When all the connections are done, change the DIP switch #1 to "ON" position and press the Reset button or reset the power on the iServer. The Hyper Terminal screen will acknowledge your connection by asking for the command.

DIP switch # 1 shown in “ON” position

Type "IP=xxx.xxx.xxx.xxx" and press Enter.

The screen will acknowledge that your command was executed.

You can also set the iServer’s gateway and subnet mask by typing "GW=xxx.xxx.xxx.xxx" and "SM=xxx.xxx.xxx.xxx", respectively.

Then type q and press Enter

You can now change the DIP switch #1 back to the “OFF” position and reset the power on the iServer.

Figure 4.13 DIP Switch #1

![DIP Switch #1](image)

Type "GW=xxx.xxx.xxx.xxx" and press Enter.

The screen will acknowledge that your command was executed.

You can also set the iServer’s gateway and subnet mask by typing "GW=xxx.xxx.xxx.xxx" and "SM=xxx.xxx.xxx.xxx", respectively.

Then type q and press Enter

You can now change the DIP switch #1 back to the “OFF” position and reset the power on the iServer.

**Figure 4.14 Setting the IP address via the Serial Port**

You need to make sure to setup the following parameters on your terminal emulation program (i.e. Hyper Terminal)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud Rate</td>
<td>9600 b/s</td>
</tr>
<tr>
<td>Data Bit</td>
<td>8 bits</td>
</tr>
<tr>
<td>Parity</td>
<td>None</td>
</tr>
<tr>
<td>Stop Bit</td>
<td>1 bit</td>
</tr>
<tr>
<td>Flow Control</td>
<td>None</td>
</tr>
<tr>
<td>Local Echo</td>
<td>Enable</td>
</tr>
<tr>
<td>Line Feeds</td>
<td>Enable</td>
</tr>
</tbody>
</table>

You can access the iServer’s complete settings by connecting the iServer’s serial port to your PC’s COM port using a null-modem cable. Bring up a terminal emulation program (i.e. HyperTerminal) and make sure the right COM port is selected and the serial communications settings (baud rate, character bit, stop bit, and parity) match the iServer’s serial port. Power the iServer on and press the Enter key within 5 seconds of powering the iServer. The iServer will then transmit its complete configurations to the PC.
4.3 Setting a New IP Address using the Serial Port (continued)

All that is left for you to do, is to use a straight/normal network cable to connect the iServer to an Ethernet hub and power it up. Then you can go to your computer that is connected to the same network and from the MS-DOS-Prompt window type "ping 192.168.1.70" where 192.168.1.70 is the new IP address for the iServer.

![Ping 192.168.1.70 from the MS-DOS Prompt](image)

This proves that the connection is proper and you can access the iServer using the Telnet or Web browser.
4.4 Setting a New IP Address over the Network

Besides using the iCONNECT software, you may use the iServer’s default IP address to access it and assign a new IP address to it.

The iServer is shipped with a default IP address of **192.168.1.200** and Subnet Mask of **255.255.255.0**. You can configure your PC’s Network connection with an IP address that is in the same range as the iServer’s IP address (192.168.1.x) and connect to the iServer using a crossover network cable between your PC and the iServer.

With this completed, you can go to the DOS-Prompt and ping **192.168.1.200**. If you receive responses back (Figure 4.15), you can go to the Web browser and type in **http://192.168.1.200** and it will take you to the iServer’s Home Page.

Select **Access Control** button, you’ll be asked for the password. First default LOGIN password is "12345678" and the ADMINISTRATOR password is "00000000", then you should be on the Access Control page were you can simply type in the desired Static IP address, and click Save.

For more details about the “Access Control” page refer to Section 4.2.5.

![Access Control](image)

**Figure 4.16 Access Control**

For the IP address to take effect the iServer needs to be turned OFF/ON or press the Reset button.

Once all of this is done, you can connect the iServer to an Ethernet hub using a straight through cable, power it up, and follow the ping routine mentioned in the previous section.
### 4.5 Terminal Server Function

It is used to provide dedicated connectivity between computers and serial devices through the iServer over the Ethernet, without dedicated wiring. The typical Internet protocol consists of a request and a reply to that request. In this situation the server is the Host that generates the request and receives the reply from the device, that gets forwarded to the appropriate party on the network. But there are specific applications where a message is generated by the device, and the server is simply passing the data to the appropriate party on the network, in this situation the server acts as Slave. Examples are the Attendance Time Clocks, Bar Code Readers, remote Displays or Electronic signboards, etc.

For the iServer to pass the data back and forth between its Serial and Ethernet interfaces, the Terminal Server option needs to be configured as follows (Figure 4.17):

1. Set the Server Type to **Slave**
2. Set the Number of Connections to **1** or higher.
3. Set the **Local Port** number to any number from 599 - 9999, except numbers 1000 and 2002.
4. Press the **Save** button to store the new settings.

From your application software on the host machine, you can now point to the IP address of the iServer and the assigned port number to establish a TCP connection to your serial device connected to the serial port of the iServer.

**Note**: If DIP switch #4 is “ON”, Terminal Server function is always enabled, regardless of the firmware configuration. By default, this DIP switch is set to “OFF” position. You have the option to enable the Terminal Server feature either through the firmware or the DIP switch #4.

---

**Figure 4.17 Terminal Server Configuration**
4.6 Terminal Emulation

On this page you can send and receive data to and from the serial device. Simply, type the command in the white area and as you type the characters, the characters will be transmitted out from the serial port of the iServer. If you want to send the whole command as a word, simple paste the word in the same area. This is an excellent tool to retrieve data from the serial port without any special software, only a web browser.

![Terminal Emulation](http://192.168.1.200)

**Figure 4.18** Terminal Emulation
4.7 Telnet Setup

Telnet stands for Telecommunications Network, is a protocol that provides a way for users (or clients) to connect to computers (or servers) on a network, whether in the next building or across the other side of the world.

You can open a Telnet session using other terminal emulation programs like Tera Term Pro (downloadable from the internet), which is a free software for MS-Windows. It supports VT100 emulation, Telnet connection and serial port connection.

Once the Telnet mechanism is decided we can open a session by simply typing the IP address of the iServer, and setting the Port on 2002 for logging into the iServer Configuration page or 2000 for accessing the serial device connected to the iServer’s serial port.

![Tera Term Telnet Connection Screen](image1)

**Figure 4.20**
Telnet Setup
iServer Configuration Page

The default password for Telnet Login is 00000000 and can be changed if desired. Telnet works only in RS-232 mode.
4.7 Telnet Setup (continued)

In the Configuration mode you can make any changes just like you would do using the Web Browser. After connected to the iServer, the user can use the following commands to read, modify, and get help from the iServer console.

- ? Following with a return character, the console will show all the commands and options (Figure 4.21).
- p Following with a return character, the console will show the iServer configurations (Figure 4.20).
- s Is the configuration command, used to set a new setting (see the example in Figure 4.21).
- r This command is used to read the status of the digital I/O signals (0 is low and 1 is high).

  Example:
  - r DCD response will be DCD (DSR)=0
  - r DTR response will be DTR=0

- w This command is used to change the status of the digital I/O signals (applies only to the outgoing signals, DTR and RTS).

  Example:
  - w RTS=1 means raise the RTS
  - w DTR=0 means lower the DTR

- reset Following with a return character, it will recycle the Power on the iServer.
- Factory Following with a return character, it will set the iServer to its factory default settings.

```

Figure 4.21 Telnet Setup - iServer Help Page
4.8 HTTPGET Program

You can setup and read the information from the iServer by using the HTTPGET program. The following program can be used to read data from the embedded server firmware by using TCP port 1000. The command string sends to this TCP port, then it reads back the response from the same port. Whatever you write to the port goes to the serial port unmodified. Any response from the serial port can be read back from the same socket.

The Httpget.exe file is used to setup and read information from the iServer. This file will be automatically installed when you install the Mail Notifier software available on our website and CD.

Example to use the "Httpget" program:

1. Create a directory C:\iServer\Httpget.
2. Copy httpget.exe and readme_features.doc files to this directory.
3. Make sure that you are in this directory and then enter the following test program:

```plaintext
C:\iServer\Httpget\httpget –r –S "*01X01\r" 192.168.1.200:1000
```

where:

"-r –S" are switches before the command string

"01" is device address (in hex format) for RS485 communication interface (skip for RS232)

"X01" read measurement data value (iSeries protocol)

"\r" calls out a CR

"192.168.1.200" is an IP address

"1000" is a local port number

Respond:

01X01074.3

where:

"01X01" is Echo command

"074.3" is a display reading of the 4-digit device

In the example above the 4-digit iSeries controller has been connected to the serial communication port of iServer.
4.9 ARP Protocol

ARP is the Internet layer protocol responsible for determining the MAC (hardware) address that corresponds to a particular IP address. The ARP command allows the user to view the current contents of the ARP cache of the local computer (residing on the same network) or remote computer (residing on the different network) through a router. Microsoft includes the ARP.EXE utility for viewing and modifying the ARP cache with its Windows products. The following ARP commands can be used to view cache entries:

- **arp –a** → Use this command to view all ARP cache entries.
- **arp –a** plus **IP address** → Use this command to view ARP cache entries associated with one particular interface on a network with multiple adapters.
- **arp –g** → Same as **arp –a**.
- **arp –N** → Use this command to display ARP entries for specific network interface.
- **arp –s** plus **IP address** plus **Physical address** → Use this command to manually add a permanent static entry to the ARP cache.
- **arp –d** → Use this command to manually delete a static entry.

Ping the destination computer using IP address first before using the **arp -a** command.

The following window shows examples of arp commands and responses.

- Your computer has an IP address of **192.168.1.118**
- The destination computer has an IP address of **192.168.1.96**

![Figure 4.22 ARP Commands and Responses](image)

```plaintext
C:\>arp - 192.168.1.96
No ARP Entries Found
C:\>ping 192.168.1.96
Pinging 192.168.1.96 with 32 bytes of data:
Reply from 192.168.1.96=bytes=32 time=5ms TTL=32

Figure 4.22 ARP Commands and Responses
4.10 Remote Access (Tunneling)

To "tunnel", in this context, is to transmit data between two points through a private conduit on a shared or public network. The network could be an Ethernet LAN, a WAN, or the Internet. The iServer allows for a connection between a serial device and a PC, or between two serial devices, using an existing network rather than dedicated wiring.

Today, there are many serial devices like sensors, gauges, PLCs, card readers, security alarms, barcode scanners, data loggers, video cameras, ATM machines, time & attendance terminals, medical lab equipments, electronic signboards, and many others that are directly connected to PCs via their serial ports.

These devices can be attached to shared Ethernet networks (TCP/IP protocol) and get accessed, controlled, and managed remotely using the iServer products. Any two iServer’s can talk to each other over the Ethernet LAN, WAN, and Internet using TCP/IP protocol. Therefore, the connected serial devices to iServer’s can also communicate with each other back and forth over these networks. This characteristic is called Tunneling and it’s illustrated in Figures 4.23.

![Figure 4.23 Serial Tunneling](image)

In order to use this Tunneling feature, some settings are required within the local and remote iServer’s.
4.10.1 Remote iServer
It’s recommended to configure the Remote iServer and have it up and running before the Local iServer is configured.

1. A static IP address must be assigned to the Remote iServer. This means that the DHCP must remain disabled. Refer to the DHCP section of the user’s manual for details.

2. Use a browser to access the Remote iServer’s WEB page. Simply type the iServer’s IP address at the browser’s URL location (i.e. 192.168.1.50) followed by an Enter key. You should then see the iServer’s main WEB page.

3. Click on the Update button.

4. Click on Configuration, you will be prompted with a Password (default is 12345678).

5. On the Configuration page, under Serial Communication section, make sure the parameters such as Baud Rate, Data Bits, Parity, Stop Bits, Flow Control, etc. match with your attached serial device.

6. Make sure to set the End Character (Hex) to 00 and the Timeout to 0.

7. Under Terminal Server section, set Number of Connections to 1 or higher.

8. Click on Save button for the changes to take place.

Make sure that the serial cable and communication settings between the iServer and the serial device are valid.

Figure 4.24 shows the valid values that need to be set in the Remote iServer. The Baud Rate, Data Bits, Parity, Stop Bits, Flow Control, and Transceiver values depend on what the serial device supports.
4.10.2 Local iServer
1. An IP address should be assigned to the iServer dynamically or statically (recommended).
2. Use a browser to access the Local iServer’s WEB page. Simply type the iServer’s IP address at the browser’s URL location (i.e. 192.168.1.49) followed by an Enter key. You should then see the iServer’s main WEB page.
3. Click on the Update button.
4. Click on Configuration, you will be prompted with a Password (default is 12345678).
5. On the Configuration page, under Serial Communication section, make sure the parameters such as Baud Rate, Data Bits, Parity, Stop Bits, Flow Control, etc. match with your attached serial device and its application software.
6. Make sure to set the End Character (Hex) to 00 and the Timeout to 0.
7. Under Terminal Server section, set the Number of Connections to 0.
8. Under Remote Access section, set the Remote Access to enable, Enter the Remote IP address (would be the IP address of the remote iServer, 192.168.1.50), and use the default Remote Port number 2000.
9. Set Connection Control to Reconnect and set the Connection Timeout to a desired value.
   - The Reconnect option is used in Serial Tunneling and it applies only to the Local iServer. If the tunneling connection between the two iServers goes down due to network problems, power failure, etc., the Reconnect option will enable the Local iServer to reconnect with the Remote iServer based on the specified time interval in the Connection Timeout. For example, based on a timeout of 1000 x 10 ms (10 seconds), the Local iServer will continually attempt to reconnect and re-establish the tunnel with the Remote iServer every 10 seconds.
10. Click on Save button for the changes to take place.
11. Initialize the serial device application software to establish the connection.

Figure 4.25 shows the valid values that need to be set in the Local iServer. The Baud Rate, Data Bits, Parity, Stop Bits, Flow Control, and Transceiver values depend on what the attached device to the iServer supports.
4.10.3 Tunneling Troubleshooting

Using the original serial cable, please confirm valid communication between the serial device and its application software on the PC with no iServers in between (direct serial connection).

A successful connection is evident when the Remote Access drop down menu in the Configuration page shows enable. This proves that the Serial Tunnel between the two iServers is up and running. Otherwise, reset the power, first on the remote iServer and then on the local iServer and recheck for Remote Access drop down menu as enable.

A quick way to check the LAN and serial tunneling connection is to separately access each iServer WEB page via the Ethernet. If successful, this should prove a valid LAN connection.

For serial tunneling, open a HyperTerminal session on the PC pointing to the same COM port to which the Local iServer is connected and type/send some characters. This should cause the Rx LED on the Local iServer to blink as it receives the data from the serial port and onto the LAN. Accordingly, the Tx LED on the Remote iServer should blink as it transmits the data from the LAN into the serial device. If no LEDs blink, then that could possibly point to the iServer connection in trouble - particularly, the serial cabling and/or the serial settings (Baud rate, stop bit, parity, etc.) throughout the communication path between the PC, the iServer, and the serial device.

4.11 iPORT, COM Port Redirector

To obtain the iPORT software (iPORT.exe file) please use the phone number, as listed on the cover of this manual, to contact the Sales Department nearest you.

To install the iPORT application, simply double-click on the iPORT.exe file and follow the installation steps. The iPORT is compatible with Windows NT, 2000, and XP operating systems.

4.11.1 iPORT Overview

The iPORT is a COM port redirecting software for Windows NT, 2000, and XP. Its function is to redirect connections that are destined for a local serial (COM) port on a PC, to an iServer network-enabling device on the LAN. In a direct serial connection, application software can communicate directly over an RS232 or RS485 with a serial device (Figure 4.26).

By installing iPORT software on the same PC, the iPORT will redirect the serial connection from the COM port to the network port on that PC. The connection can simply reach the serial device through an iServer sitting anywhere on an Ethernet network (Figure 4.27). This connection redirection is totally transparent to the serial device and its application software. Once the connection is up from the PC to the serial device, the data is transmitted across the Ethernet network to the serial device and back from the serial device to the PC, all through the iServer and the iPORT.
4.11.1 iPORT Overview (continued)

Figure 4.26 Direct Serial Connection

Figure 4.27 Redirect Serial Connection

4.11.2 iPORT Configurations

After the iPORT is successfully installed on your windows machine, you will have an iPORT icon on your desktop and Control Panel window. By double-clicking on this icon, you can start the application and the iPORT main window will appear on your screen (Figure 4.28).

Click on "COM Ports" button and you will see the window on Figure 4.29. Select the appropriate COM port (this should be the same COM port that your application software uses). The selected COM port will then appear on the main iPORT window. By highlighting the selected COM port, you will be able to add the IP address and the port number to connect that COM port to the iServer on the network.

Up to 255 COM ports can be selected and each can have a different IP configuration pointing to different iServers on the network. This enables users to simultaneously redirect different application software to connect to serial devices attached to networked iServers.
4.11.2 iPORT Configurations (continued)

**Figure 4.28** iPORT Main Window

**Figure 4.29** COM Port Window

**iServer IP Address** – This is the IP address of the iServer that is connected to the serial device on one end and attached to the Ethernet LAN on the other end. The iServer’s default IP address is **192.168.1.200**, which can be changed to fit your network IP address range (see the iServer’s manual for details).

**iServer Port Number** – This is the port number for the iServer’s local serial port. The default value is 2000. If this port number is changed in the iServer’s Configuration page (see the iServer’s manual for details), the same number should be placed in the iPORT window.

**Activate** – If this box is checked, the selected COM port will be available for network connection. If it is unchecked, the selected COM port will be in sleep mode.
4.11.2 iPORT Configurations (continued)

**Timeout** – This is the amount of time (in milliseconds) in which the iPORT keeps the application software waiting before the device response is arrived. The default value is 5 seconds and it can be set between 0 to 10 seconds.

**Status** – This window shows the connection status as the iPORT makes connection to the iServer or disconnects from the iServer. The connection status can be ideal, connecting, connected, or disconnected along with the IP address of the iServer shown in the Status window.

**Apply button** – To save the configuration for a selected COM port, click on the "Apply" button and reboot your PC for settings to take place in your Windows registry.

**Clear button** – This button deletes the settings for a selected COM port.

**Cancel button** – This button closes the iPORT window without saving the settings.

In Figure 4.29, if a COM port number is dimmed and cannot be selected, it means that the COM port is already used by another application or it could be a physical serial COM port on that PC.

The serial communication settings (baud rate, data bit, stop bit and parity) of your application software must be identical to the serial communication settings of the iServer’s serial port and your serial device’s port connected to the iServer. You can use a Web browser to log into the iServer and configure its serial port’s settings (see the iServer’s manual for details).

4.12 Mail Notifier Software

The Mail Notifier Software can be used only with NEWPORT Electronics instruments.

For complete information of how to use the Mail Notifier software, click on the Help menu of the main window.

The Mail Notifier software generates email notifications for alarm conditions. Users can be notified automatically of alarm conditions monitored via internet connections throughout the world. By use of the email forwarding of alarm conditions, alarm conditions can be monitored on a network isolated from the internet and forwarded to connections on the Internet.

The Mail Notifier utility operates under Windows 98, NT 4.0, 2000, and XP in conjunction with existing email that supports the MAPI messaging interface. If MS Outlook has been loaded, the MAPI support should be available.

4.12.1 Mail Notifier Installation

The Mail Notifier must be loaded on a computer running Microsoft Windows (versions specified earlier) using an email program that provides MAPI access. Network access must be available between this computer and the iServer. Network access must also be available from this computer to the appropriate email server and from the email server to the recipient’s email server.

Figure 4.30 iServer Mail Notifier Main Window
4.12.2 Mail Notifier Program Options Setup and Configuration

Complete program setup requires:

- Entering a recipient for the email
- Specifying connection details to MAPI services.
- Defining alarms for devices, and selecting how and when the email will be active.

![Options](image)

**Figure 4.31** iServer Mail Notifier Profile Setup

The “Send To” tab contains a field to specify an email address to which alarm notifications will be sent (i.e. the recipient). Only one entry is permitted, in the address field. Additional addresses can be placed into “More Addresses” list.

**Email Connection (MAPI Access)**

The following instructions work with some versions of Microsoft Outlook. Note though that some email systems may prevent the use of Mail Notifier due to security constraints.

The simplest way to obtain a connection the Email services is as follows:

1. Configure the Mail Notifier to connect to the email by displaying a Login Box. This option is found by selecting View, Options from the Mail Notifier's menubar. Select the "Email Setup" tab, mark the checkbox for "Use Login Box"

2. After Mail Notifier is configured to use the login box, the Mail Notifier can be started without user intervention if your MS Outlook program is running beforehand. Otherwise, the Mail Notifier will display a Login Box that should display the necessary User Profile.
4.12.3 Mail Notifier Device Setting and Configuration

Device setup requires:

- Entering the **IP address** for iServer device (for example **192.168.1.200**).
- Specifying **Socket number** (1000 or 2000 depending on iServer settings).
- Defining **RS485 Unit #** interface address (1 to 199). Enter "0" for RS232 interface or for iServer.
- Entering **Reading command**. Normally set to **X01** to obtain reading from the devices. If you want to change this setting, refer to HTTPget Section 4.8.
- Defining the **Alarm setup** (High/Low, High value, or Low value).
- Specifying **Pause Interval**. It determines how many seconds each subsequential alarm notification will be sent.
- Determining **Monitor interval**. It establishes the interval or time resolution in seconds for which readings will be obtained from the device.

PART 5
SPECIFICATIONS

SERIAL INTERFACE
Interface:
RS-232, RS-422, RS-485 CMOS, or TTL
Connector:
Pin header holes (0.1” pitch)
Data Rates:
300 to 115200 bps
Characters:
7 or 8 data bits
Parity:
odd, even, or none
Stop bits:
1 or 2
Flow Control:
Software (Xon/Xoff)
Hardware (CTS/RTS)
Digital I/O’s:
4 digital input/output lines

NETWORK INTERFACE
Interface:
Ethernet 10 Base-T
Connector:
RJ45
Protocols:
ARP, TCP/IP, ICMP, DNS, DHCP,
Telnet simulation and HTTP
Indicators (LED):
Network Activity (red),
Network Link (green),
TX-Transmit (yellow),
RX-Receive (green),

PROCESSOR
CPU:
Enhanced 8051, 22 MHz
Memory:
16 Kbyte SRAM, 512 Kbyte Flash
Management:
Serial Login, Telnet Login,
Internal Web Server

EMBEDDED WEB SERVER
Uses: Dynamic web pages and Java applets (256 Kbyte capacity)

ENVIRONMENTAL
EIS-PCB and EIS-PCB-TTL
Operating Temperature:
0 to 70°C (32 to 158°F)
UL Safety Tested (EIS-PCB):
0 to 50°C (32 to 122°F)
EIS-PCB-ET and EIS-PCB-TTL-ET
Operating Temperature:
-40 to 85°C (-40 to 185°F)
Storage Temperature:
-40 to 125°C (-40 to 257°F)
Board Surface Area:
approximately 3 sq. inches
Weight:
23g (0.05 lbs).

POWER
Power Input
5 Vdc
Consumption:
0.7W average / 1 W max

GENERAL
Agency Approvals
FCC-B; CE (see CE Approval Section);
USR, CNR (recognized component for
U.S. and Canada)
Software
Firmware upgradeable. Compatible with
Windows 9x / ME / NT / 2000 / XP
software and related utilities

APPENDIX A GLOSSARY

User of this manual should be familiar with following definitions:

**ARP (Address Resolution Protocol)** is a protocol for mapping an Internet Protocol address (IP address) to a physical machine address that is recognized in the local network. For example, the IP address in use today is an address that is 32-bits long. In an Ethernet local area network, however, addresses for attached devices are 48-bits long. (The physical machine address is also known as a Media Access Control or MAC address.) A table, usually called the ARP cache, is used to maintain a correlation between each MAC address and its corresponding IP address. ARP provides the protocol rules for making this correlation and providing address conversion in both directions.

**Ethernet** is a network protocol defined by the IEEE 802.3 standard. Ethernet-based networks use MAC Address rather than IP Address to exchange data between computers. By using ARP and adding TCP/IP support, Ethernet devices may be connected as part of the Internet. An Ethernet LAN typically uses coaxial cable or special grades of twisted pair wires. The most commonly installed Ethernet systems are called 10BASE-T and provide transmission speeds up to 10 Mbps. Devices are connected to the cable and compete for access using a Carrier Sense Multiple Access with Collision Detection (CSMA/CD) protocol.

**IP (Internet Protocol)** is the method or protocol by which data is sent from one computer to another on the Internet.

**IP address (Internet Protocol address)** is a 32-bit number that identifies each sender or receiver of information that is sent in packets across the Internet.

**IP Netmask** is a 32-bit pattern of bits used to determine which part of the IP address is the network portion and which part is the host portion.

**MAC (Media Access Control) Address** is your computer's unique hardware number. When you're connected to the Internet from your computer, a correspondence table relates your IP address to your computer's physical (MAC) address on the LAN.

**Ping** is a utility that tests the network connectivity. It is used to determine if the host is capable of exchanging information with another host.

**Port number/Socket number** is a way to identify a specific process to which an Internet or other network message is to be forwarded when it arrives at a server. It is a predefined address that serves as a route from the application to the Transport layer or from the Transport layer to the application of the TCP/IP system.

**Sockets** are a method for communication between a client program and a server program in a network and defined as "the endpoint in a connection." Information transferred across the Internet primarily occurs between sockets.

**TCP/IP (Transmission Control Protocol/Internet Protocol)** is the basic communication language or protocol of the Internet. When you are set up with direct access to the Internet, your computer is provided with a copy of the TCP/IP program just as every other computer that you may send messages to or get information from also has a copy of TCP/IP. TCP/IP often is used as a general term to indicate generic access to the Internet.
Appendix B  

IP Address

An IP address is a unique 32-bit address assigned to a computer and includes:

- A network ID number identifying a network.
- A host ID number identifying a computer on the network.

All IP addresses have been divided into three smaller groups (classes) A, B and C.

- **Class A** addresses have 8-bits of network ID and 24-bits of host ID. They can support a large number of hosts, approximately $2^{24} = 16,777,216$ computers per network.

  The IP addresses range in binary from $00000001.xxxxxxxx.xxxxxxxx.xxxxxxxx$ to $01111111.xxxxxxxx.xxxxxxxx.xxxxxxxx$

  The IP addresses range in decimal from $1.x.x.x$ to $127.x.x.x$

  Class A network ID’s support a very large number of hosts.

- **Class B** addresses have 16-bits of network ID and 16-bits of host ID. They can support approximately $2^{16} = 65,536$ computers per network.

  The IP addresses range in binary from $10000000.00000000.00000000.xxxxxxxx$ to $10111111.11111111.11111111.xxxxxxxx$

  The IP addresses range in decimal from $128.0.x.x$ to $191.255.xxx.xxx$

  Class B network ID’s support a medium number of hosts.

- **Class C** addresses have 24-bits of network ID and 8-bits of host ID. They can support approximately $2^8 = 256$ computers per network.

  The IP addresses range in binary from $11000000.00000000.00000000.xxxxxxxx$ to $11011111.11111111.11111111.xxxxxxxx$

  The IP addresses range in decimal from $192.0.0.xxx$ to $223.255.255.xxx$

  Class C network ID’s support a small number of hosts.

The rest of the addresses are divided into two classes, D and E.

**Class D networks** are not assigned to the host. They are used for multicasting. The address range from 224.x.x.x to 239.x.x.x

**Class E** networks are experimental or reserved addresses. The address range from 240.x.x.x to 247.x.x.x
Appendix C  

IP Netmask

IP Netmask or Subnet Mask is a 32-bit pattern of ones and zeros used to determine network portion of an IP address from the host portion of the IP address. Subnet mask is a network ID that is created by borrowing bits from host portion of IP address and using them as part of a network ID. The table below shows a default subnet mask for address Classes A, B, and C. Each bit that is set to "1" in the subnet mask corresponds to the bit in the IP address that is to be used as the network ID. Each bit that is set to "0" in the subnet mask corresponds to a bit in the IP address that is to be used as the host ID.

<table>
<thead>
<tr>
<th>Address Class</th>
<th>Mask Binary Value</th>
<th>Mask Decimal Value or Dotted Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class A</td>

<td>255.255.255.0</td>
</tr>
</tbody>
</table>

If your network requires more network ID’s, you can extend the default subnet mask to include additional bits from the host ID. This allows for additional network ID’s within the network. The table below shows some examples of subnet masks and bits moved from the hosts ID to create a new subnet.

</tbody>
</table>

To determine the number of valid hosts ID’s remaining after subnetting, use the following equation: \(2^n – 2\), where \(n\) is the number of octet digits left after the subnet mask.

PART 7
APPROVALS INFORMATION

7.1 CE APPROVAL

This product conforms to the EMC directive 89/336/EEC amended by 93/68/EEC, and with the European Low Voltage Directive 72/23/EEC.

Electrical Safety EN61010-1:2001
Safety requirements for electrical equipment for measurement, control and laboratory.

Basic Insulation

Pollution Degree 2

Dielectric withstand Test per 1 min
- Input Power to Ethernet Output: 1500Vac

Measurement Category I
Category I are measurements performed on circuits not directly connected to the Mains Supply (power).

Transients Overvoltage Surge (1.2/50μS Pulse)
- Ethernet: 1500V Transients Overvoltage

Note: The ac/dc power adaptor must have Safety Qualified Agency Approvals for CE with Double Insulation rating.
The ac/dc power adaptor is 9Vdc.
The minimum output current rating is 500mA.

EMC EN61000-6-1:2001 (Immunity) and EN61000-6-3:2001 (Emmissions)
Immunity requirements for residential, commercial and light-industrial environments
- EMC Emissions Table 1, Class B
- EMC Immunity Table 1: Enclosure
  Table 2: Signal Lines Ports

Immunity and Emissions requirements for electrical equipment for measurement, control and laboratory.
- EMC Emissions Table 4, Class B of EN61326
- EMC Immunity Table 1 of EN61326

Refer to the EMC and Safety installation considerations (Guidelines) of this manual for additional information.

7.2 FCC
This device complies with Part 15, Subpart B, Class B of the FCC rules.
Warranty/Disclaimer

NEWPORT Electronics, Inc. warrants this unit to be free of defects in materials and workmanship for a period of one (1) year from the date of purchase. In addition to NEWPORT’s standard warranty period, NEWPORT Electronics will extend the warranty period for one (1) additional year if the warranty card enclosed with each instrument is returned to NEWPORT.

If the unit should malfunction, it must be returned to the factory for evaluation. NEWPORT’s Customer Service Department will issue an Authorized Return (AR) number immediately upon phone or written request. Upon examination by NEWPORT, if the unit is found to be defective it will be repaired or replaced at no charge. NEWPORT's WARRANTY does not apply to defects resulting from any action of the purchaser, including but not limited to mishandling, improper interfacing, operation outside of design limits, improper repair, or unauthorized modification. This WARRANTY is VOID if the unit shows evidence of having been tampered with or shows evidence of being damaged as a result of excessive corrosion; or current, heat, moisture or vibration; improper specification; misapplication; misuse or other operating conditions outside of NEWPORT’s control. Components which wear are not warranted, including but not limited to contact points, fuses, and triacs.

NEWPORT is pleased to offer suggestions on the use of its various products. However, NEWPORT neither assumes responsibility for any omissions or errors nor assumes liability for any damages that result from the use of its products in accordance with information provided by NEWPORT, either verbal or written. NEWPORT warrants only that the parts manufactured by it will be as specified and free of defects. NEWPORT MAKES NO OTHER WARRANTIES OR REPRESENTATIONS OF ANY KIND WHATSOEVER, EXPRESSED OR IMPLIED, EXCEPT THAT OF TITLE, AND ALL IMPLIED WARRANTIES INCLUDING ANY WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE HEREBY DISCLAIMED. LIMITATION OF LIABILITY: The remedies of purchaser set forth herein are exclusive and the total liability of NEWPORT with respect to this order, whether based on contract, warranty, negligence, indemnification, strict liability or otherwise, shall not exceed the purchase price of the component upon which liability is based. In no event shall NEWPORT be liable for consequential, incidental or special damages.

CONDITIONS: Equipment sold by NEWPORT is not intended to be used, nor shall it be used: (1) as a “Basic Component” under 10 CFR 21 (NRC), used in or with any nuclear installation or activity; or (2) in medical applications or used on humans. Should any Product(s) be used in or with any nuclear installation or activity, medical application, or used on humans, or misused in any way, NEWPORT assumes no responsibility as set forth in our basic WARRANTY / DISCLAIMER language, and additionally purchaser will indemnify NEWPORT and hold NEWPORT harmless from any liability or damage whatsoever arising out of the use of the Product(s) in such a manner.

Return Requests/Inquiries

Direct all warranty and repair requests/inquiries to the NEWPORT Customer Service Department. BEFORE RETURNING ANY PRODUCT(S) TO NEWPORT, PURCHASER MUST OBTAIN AN AUTHORIZED RETURN (AR) NUMBER FROM NEWPORT’S CUSTOMER SERVICE DEPARTMENT (IN ORDER TO AVOID PROCESSING DELAYS). The assigned AR number should then be marked on the outside of the return package and on any correspondence.

The purchaser is responsible for shipping charges, freight, insurance and proper packaging to prevent breakage in transit.

FOR WARRANTY RETURNS, please have the following information available BEFORE contacting NEWPORT:
1. P.O. number under which the product was PURCHASED,
2. Model and serial number of the product under warranty, and
3. Repair instructions and/or specific problems relative to the product.

FOR NON-WARRANTY REPAIRS, consult NEWPORT for current repair charges. Have the following information available BEFORE contacting NEWPORT:
1. P.O. number to cover the COST of the repair,
2. Model and serial number of product, and
3. Repair instructions and/or specific problems relative to the product.

NEWPORT’s policy is to make running changes, not model changes, whenever an improvement is possible. This affords our customers the latest in technology and engineering.
